## **DETAILED ACTION**

1. Claims 1-19 are presented for examination.

### ***Specification***

2. The lengthy specification has not been checked to the extent necessary to determine the presence of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.

### ***Claim Objections***

3. Regarding claim 12, line 1, should be changed 'interface" to –wireless interface – as defined in claim 11.

### ***Claim Rejections - 35 USC § 102***

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000.

Art Unit: 2827

Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

5. Claims 1-19 are rejected under 35 U.S.C. 102(e) as being clearly anticipated by Parkinson et al. (U.S. Patent No. 6,795,338).

Regarding claims 1,6, Parkinson et al. disclose a method comprising forming a phase change memory element (Figure 4, 130) to be read with a voltage greater than or equal to the threshold voltage of the element (Column 3, lines 60-67, Column 4, lines 1-3).

Regarding claims 2-3, 7,9, Parkinson et al. including forming a phase change memory element to have a holding voltage that is at least 80 percent of the threshold voltage of the element (Column 4, lines 58-67, Column 6, lines 41-67), and a phase change memory element to have a threshold that does not vary more than 10 percent with programming currents varying as much as two times (Column 7, lines 63-67, Column 9, lines 24-67, Column 10, lines 1-55).

Regarding claims 4-5,7, 10, Parkinson et al. disclose forming a phase change memory element including a phase change material between a pair of electrode (Column 4, lines 15-18), and a phase change material with a lower electrode of titanium silicon nitride (Column 5, line 22).

Regarding claims 11, 17-19, Parkinson et al. disclose a system (Figure 20) comprising:

a processor (865);

a wireless interface coupled to the processor (880);

a phase change memory element (Figure 4, 130) to be read with a voltage greater than or equal to the threshold voltage of the element (Column 3, lines 60-67, Column 4, lines 1-3), and includes a dipole antenna (Column 20, lines 39).

Regarding claims 13-16, Parkinson et al. disclose forming a phase change memory element including a phase change material between a pair of electrode (Column 4, lines 15-18), and a phase change material with a lower electrode of titanium silicon nitride (Column 5, line 22), and including forming a phase change memory element to have a holding voltage that is at least 80 percent of the threshold voltage of the element (Column 4, lines 58-67, Column 6, lines 41-67), and a phase change memory element to have a threshold that does not vary more than 10 percent with programming currents varying as much as two times (Column 7, lines 63-67, Column 9, lines 24-67, Column 10, lines 1-55).
